# About Us

## We're on a mission!

Our vision is to create a unique DeFi project where you can build your own empire on NFT. The metaverse is a fascinating new world of virtual land with a myriad of possibilities. With metainfra you can build your unique structures and build your own empire. We aim at building sustainable communities in the metaverse which will bring companionship to the citizens to enjoy the virtual world. Be the owner of your custom artform carved out on the Binance Smart Chain NFT in blockchain.

# About Us

These structures can be traded with their currency and can be interoperable in other worlds as building blocks to assemble a town or city. Imagine showcasing your authentic buildings or trading your structure or whole city in exchange for the MetaInfra Coin. You can allow other citizens of the metaverse to enjoy your structures making the metaverse experience fun and enjoyable. You can import your structures into other worlds, you can flaunt your buildings, bridges, etc. You can customize your structures easily with any color, texture, size. No worry of keeping your virtual apartment clean or getting old. Dream of living in Paris, you can create your own city.

# How it works

METAINFRA is the first of its kind crypto project where users can create infrastructures on NFT and import them into the metaverse. These structures can be traded with their currency and can be interoperable in other worlds as building blocks to assemble a town or city. It is completely decentralized and the users are the owner of the structures in the metaverse. In the second phase of the project, metainfra aims to construct its own metaverse where users can play games, organize events or simply enjoy exploring the metaverse. The token is built on the Binance Smart Chain (BSC).

# New to crypto world?

Crypto space throws jargon at you which can be hard to comprehend like DeFi, Mining SmartContracts, Blockchain, Minting, BinanceSmartChain, etc. These terms can be quite confusing and many people don't fully understand it's real world implications, which leads to resistance for the newly emerging technologies. To comprehend Crypto and DeFi, it is necessary to first understand Blockchain. It's a ground-breaking piece of software technology that essentially lets any piece of data be stored in a decentralized, hack-proof manner. When something is transacted, such as a financial transaction, it is recorded on a chain, which grows with each transaction and is intricately linked to one another. The sole purpose of bitcoin was to revolutionize the way financial institutions worked, so the creator of bitcoin built the Blockchain technology to create a new type of currency that is free of government bureaucracy, corruption, and centralization. It's the first step towards creating decentralized finance (DeFi).

# New to crypto world

Bitcoin could only handle simple logics. The shortcomings of Bitcoin were fulfilled by Ethereum which could handle more sophisticated logic using the smart contracts. Soon after NFT's (Non Fungible Token) were launched which changed the way we own things digitally. A non-fungible token is a non-interchangeable unit of data stored on a blockchain, a form of digital ledger. Therefore, the owner of the data can always validate that he or she is the real owner of the piece of digital information. This has revolutionized the digital art and metaverse.

# Tokenomics

A successful team starts with hiring the right people—those who value working toward a common goal, are goal-oriented, and respect the hierarchical structure that most businesses require. We have cherry picked our team members who are masters of their domain.
